AutoCAD history AutoCAD is a commercial product developed and marketed by Autodesk. It was initially a drawing program with word-processor-like functions. Eventually, the application began to modelize geometric shapes in a similar fashion to CAD software like SolidWorks and Inventor. AutoCAD's rapid rise in popularity led to a large number of clone software applications that are not approved by Autodesk, such as Taligent's AutoCAD LT (and its successor AutoCAD 2000), CGT's CATIA, Silas Software's Architect, 3dsMax, etc. The companies that produce such software are called CADx. Introduced in 1982, the first AutoCAD version was a desktop graphics application running on microcomputers with a limited graphics hardware (2-bit graphic display). In January 1983, the first beta version of AutoCAD was announced. This is the first major milestone since the program's beginnings, as this version was meant to be the first usable version. It was released in August 1983. AutoCAD's major competitor at the time was the equally popular (in the industry) spreadsheet software named VisiCalc. It was developed by the Stanford Research Institute and was acquired by Apple Computer in 1983. It was originally named "System 4", but the name was changed when VisiCalc was acquired. In the years that followed, Apple used the word "Calc" to represent the word "Calculator". In 1984, the first version of AutoCAD called "AutoCAD for DOS" was introduced. It was the first version of AutoCAD to use the command line, the predecessor to the "menu bar" and the concept of the "command line window" that is found in many CAD programs today. A new version of AutoCAD, named AutoCAD for Windows, was released in 1985. It was the first version of AutoCAD that was available

How do I return the output of this command in a variable? $ echo $(($((1.6 * 5)))) I know that I can do: $ echo $(($((1.6 * 5)))) | awk '{print $1}' 1.6 But I want to return this value as a variable. A: Declare it first: $ var=($(($((1.6 * 5))))) Another way is to use $$: $ var=$$ To save it in a shell variable: $ echo $var $1.6 Alternatively you can use the standard way: $ eval $var=\$(($((1.6 * 5)))) In the last example if $var is empty then it will evaluate the command $(($((1.6 * 5)))) Edit: Note that in the last two examples there is a backslash (\) before the $var assignment. If this isn't there then it will evaluate the command as if it is placed in double quotes. So if the line is: $ var=$(($((1.6 * 5)))) then in the variable the command will be evaluated as: $1.6 = $((1.6 * 5)) and the result of the eval command would be: $((1.6 * 5)) A: Put the variable in front of the command: echo $var=$(($((1.6 * 5)))) You can use backticks to execute commands and assign their output to a variable: echo $`echo $(( 1.6 * 5 ))`

For example, a double-data-rate three synchronous dynamic random access memory (DDR3 SDRAM) has nine bit lines and nine sense amplifiers, and thus has a storage capacity of approximately 16 gigabits of memory. In contrast, a DDR3 SDRAM with the same storage capacity has 18 bit lines, including two data bit lines and 16 dummy bit lines, and has six sense amplifiers. The additional data bit lines and sense amplifiers allow the DDR3 SDRAM to achieve a higher effective frequency of operation. The bit lines in the DDR3 SDRAM are coupled to sense amplifiers in the same row through metal oxide semiconductor (MOS) switches controlled by a write enable signal and a column address signal. The M
